PROGRAM CLARIFICATIONS - Phase 2 CMAR Selection

Schedule:

Phase 1a - completed ahead of May 2025 KSHSAA State Track Meet

Phase 1b - anticipated completion - March/April 2026
Phase 2 - anticipated construction start following May 2027 KSHSAA State Track Meet;
Construction of Phase 2 to be phased as needed to accommodate the May 2028 KSHSAA State Track Meet.

Budget:

Phase 2 construction budget is \$17 million (total project cost of \$22 million) with the potential to increase up to \$38 million total project cost pending fundraising. Project budget will be set ahead of contractor selection.

Scope/Priorities:

Phase 2 will include replacement and/or modifications to the existing west side stadium structure to include seating for 6,500 spectators (including accessible seating areas), updated restrooms, a press box, and accommodations for future expansion/improvements.

Project Description

PROJECT DESCRIPTION

The Wichita State University Stadium Replacement provides new athletics and campus facilities to support existing and future university, high school, and community-based programs. The project is located on the previously developed Cessna Stadium site located adjacent to the Charles A. Koch Arena and the new WSU Student Athlete Center. Some building services are supported by available mechanical capacity at the Arena. The project replaces the outdated and aging Cessna Stadium. The east stands are slated for demolition this year as part of a separate small capital project.

The new stadium is designed for future expansion of athletics programs, specifically Women's Soccer. It includes spaces for sports medicine, equipment, indoor practice, and storage, all of which current athletics programs have outgrown available existing space. Indoor practice and training spaces include space for throws and an inclined 60-80M track.

The East Pavilions include flexible amenity spaces that may be used for visiting team facilities and back of house areas to support crew and performer needs during outdoor concerts at the stadium.

A new wider track supports a competition size natural turf soccer field on the infield. New throws areas and jumps are included within the stadium scope. The spectator seating is distributed around the entire track for an enhanced experience and premium atmosphere for athletic competition throughout the track & field level.

The seating capacity is designed for 14,000 spectators. Large enough to comfortably host the annual State High School Track & Field Championships, as it has historically. Unique to this event is the multitude of teams participating each year from across the state of Kansas.

Teams collectively descend upon WSU and stage their team areas with tents and accommodations for State Championships each May. The new stadium anticipates this event and provides a range of accommodations and seating types, for athletes, coaches, parents, and spectators.

Modern restrooms and concessions areas are distributed around the site for spectator convenience and to ensure full capacity events can be sufficiently accommodated. Accessible and companion seats allow for selection by viewing preference and are distributed throughout the stands at various elevations and vantage points. The site is designed for full accessibility to all levels and barrier free circulation around the site perimeter via walkways and paths. Vertical circulation via elevators is provided in the West Grandstand.

Pedestrian plazas on the east and west sides of the site provide opportunities for outdoor events. The west pedestrian plaza connects to the arena as well as the new ground level interior concourse of the West Grandstand providing for breakout area and outdoor event space. The concourse area not only provides event space but also may be used as an emergency shelter during inclement weather.

The WSU Stadium Replacement supports events that are unable to be accommodated elsewhere on campus or in Wichita today. It supports the needs for this type of facility in the region as a multi-functional facility able to host various events, such as large banquet gatherings, festivals, and outdoor concerts.

Program

INTRODUCTION

Program

The program for the new stadium was developed in collaboration with the key stakeholders for the venue and the University.

On January 12th and 13th, Populous and GLMV Architects led a series of one-hour interviews and focus groups with a variety of stakeholders (see below for a full list). The discussion revolved around the culture and mission of the University, the vision of Athletics, and the needs of the organizations and student-athletes who use the existing venue.

Building Systems

Building Systems Narratives

ARCHITECTURAL

The new WSU University Stadium is an open-air stadium with a mix of related athletics and event spaces; interior and exterior concourse areas; indoor training areas; athletics facilities including offices, support areas, locker rooms, and sports medicine; public restrooms and concessions areas; event operations and press facilities. The primary structure is planned as steel framing and is to be provided with suitable weather protective and decorative finishes or claddings. Split-slab concrete floor assemblies provide weather enclosure for interior areas beneath exterior concourses and seating bowl. A canopy above the west grandstand provides shade to the seating areas. The seating bowl is designed with pre-cast concrete seating units and bleacher seating. Exterior finishes include a combination of brick veneer matching adjacent campus architecture with metal panel rainscreen above. Openings include aluminum framed windows, glazed upward acting doors for large ground level openings and glazed storefront at main entries.

High traffic areas, such as concourses, restrooms, and concessions are planned to have durable, low maintenance finishes such as concrete masonry unit (CMU) walls and sealed concrete floors. Low traffic areas, such as offices and support areas, are metal framed with gypsum wallboard for flexibility to allow future reconfiguration of spaces. Ceilings are a combination of exposed open ceilings and suspended architectural ceilings depending on the use and function of each space.

The site is designed to provide barrier free circulation to all areas for spectators, athletes, and performers. Walkways and plazas utilize paving and patterns matching adjacent campus areas and extend the

campus landscape design across the new stadium site.

The stadium is designed to meet or exceed all applicable code requirements required by the local authorities having jurisdiction and as adopted by the State of Kansas and referenced in the State of Kansas Building Design and Construction Manual.

A future potential connection to Koch Arena is planned as a multi-function banquet space that serves both the new University Stadium at the upper concourse level and Koch Arena at the upper bowl level with the ability to host 500 individuals. The space allows for both pedestrian and vehicular circulation under the connection.

The University Stadium project is broken into phases - Phase 1A, Phase 1B, and Phase 2.

The Phase 1A improvements will consist of new east side stadium seating, parking lots, sidewalks, courtyard/plaza space, concessions and restroom facilities.

The Phase 1B improvements will consist of new north and south stadium seating, new track and field and storage facility and will connect into the Phase 1A stadium seating as well as the existing west grandstands.

The Phase 2 improvements will consist of new west side grandstands, parking lot improvements, sidewalks and courtyard/plaza space between the new grandstands and Koch Arena.

CIVIL

Phase 1A

The new improvements will be construct-

ed on the east side of the existing stadium. The existing east grandstands will have been removed with a previous project. Phase 1A improvements will impact the existing parking lot and sidewalks between the east grandstands and Devlin Hall. Existing easements will be vacated. Existing underground fiber and Evergy electric will need to be relocated.

All utilities appear to be present to serve the new concessions and restroom buildings.

Phase 1B

Phase 1B improvements will impact and remove the existing track and infield and associated storm piping along with existing retaining walls and throwing areas.

Storm piping will be modified to drain the new track and infield and will be sized for future turf infill within the infield.

Phase 2

The Phase 2 improvements will be constructed on the west side of the stadium and will impact and remove the existing west grandstands, parking lots north of the existing grandstands as well as between the grandstands and Koch Arena.

All utilities appear to be present to serve the new west grandstands and ancillary building spaces.

STRUCTURAL

The structural framing for the north, south, and east stands will consist of cast-in-place reinforced concrete or structural steel. The east concession and restroom buildings will be conventionally steel framed with steel joists and beams supported by steel columns. The west grandstand will be framed with steel col-

umns and composite steel beams and designed to accommodate a future connecting link with Koch Area. All structures will be supported by reinforced concrete shallow foundations.

PLUMBING SYSTEMS

Phase 1 Spaces: General Plumbing installation shall meet current code requirements and building user requests at all spaces. Plumbing fixture selections should be in alignment with user preferences as well as established standards for the university.

Domestic hot water for the concessions buildings is proposed to utilize a central gas-fired tank-type domestic hot water heating system with recirculation pump at each concessions building. Hot water delivery shall be within 15 seconds.

Phase 2 Spaces: General Plumbing installation shall meet current code requirements and building user requests at all spaces. Plumbing fixture selections should be in alignment with user preferences as well as established standards for the university.

Domestic hot water for the west grandstand is proposed to utilize gas-fired tank-type domestic hot water heating systems with recirculation pump. Hot water delivery shall be within 15 seconds.

HEATING, VENTILATING & AIR CONDITIONING SYSTEMS

The HVAC systems shall be designed to meet or exceed minimum requirements of the 2018 International Energy Conservation Code (adopted by the State of Kansas). HVAC shall be consistent with equipment selection, control, and maintainability found in other similar athletics facilities on campus.

Building Systems Cont'd

Phase 1 Spaces: It is anticipated the concessions buildings will be served by multiple direct expansion (DX) split systems with natural gas heat. The units will function as constant volume and will be selected appropriately for zoned exposures and occupancies. Estimated capacity is 15 tons per building. Code-mandated restroom exhaust systems are proposed as well

Phase 2 Spaces: It is anticipated these spaces will be served by two variable air volume (VAV) Air Handling Units (AHU) with hot water preheat and split DX cooling condensing units. The condensing units will be concealed on the roof of stair towers. The AHU's will serve VAV terminal units for individual space control with hot water reheat. These units will be located on a mechanical mezzanine. Hot water heating will be provided by a steam converter utilizing low pressure steam presently extended from the Koch Arena boiler plant. Estimated cooling capacity is 150 tons. Servers and other data/communications equipment rooms will likely require individual mini-splits.

Code-mandated restroom and locker room exhaust systems are proposed as well. Energy code considerations will require an energy recovery system to pretreat outdoor air to provide ventilation and makeup air. A dedicated outdoor air (DOAS) unit will be specified for this service and be located on the mechanical mezzanines as well.

ELECTRICAL

Power Distribution:

The Phase 1 concessions buildings will be served by a single pad mounted utility transformer. Due to the high traffic nature, the utility transformer will be located in a screened/fenced area to limit ac-

cess. This may be a shared courtyard with mechanical equipment provided necessary clearances maintained. The proposed service to the north concessions building will be 480/277V, 3-phase, 4-wire. This building will also feed the east side stadium lighting at 480V. Distribution transformers will be provided to obtain 208/120V, 3-phase, 4-wire power. The south concessions building will be sub-fed from the north building from one of these transformers.

The Phase 2 building will be served by a separate pad mounted utility transformer. This transformer will be located within a separate screened/fenced area to limit access. The proposed service to the building will be 480/277V, 3-phase, 4-wire. This building will also feed the west side stadium lighting at 480V. Distribution transformers will be provided to obtain 208/120V, 3-phase, 4-wire power.

Power panels will be strategically located in both phases to provide local power. Both 480/277V and 208/120V remote panels will be needed. Electrical panels will be fully rated with circuit breakers. HVAC, lighting, elevators, and miscellaneous equipment will be served at 480/277V. Receptacles, small HVAC loads, and miscellaneous equipment will be served at 480/277V.

There are no plans to provide an emergency standby generator for this facility.

Concert/Event Power:

Electrical distribution for concert/event spaces will be located in the north concessions building. This equipment will feed a 400A company switch at the stage location for temporary event power, as well as a freight elevator and other receptacle and lighting power needs within the back-of-house artist space. Addition-

al power locations will be coordinated throughout the stadium to ensure maximum flexibility for future events. Trailer parking lot will have 50A, 240V receptacles for event and production trailers or tour buses.

General Electrical Distribution

All wiring will be size based on copper in conduit. Rigid galvanized steel conduit will be utilized where exposed to exterior elements, PVC conduit shall be used for underground conduit runs with PVC-coated RGS elbows and risers, and EMT conduit will be utilized in concealed interior areas. Exposed conduit will be routed parallel or perpendicular to structure. Receptacles will be specification grade 20A devices. Where required by NEC, receptacles will be GFCI type. Where located exterior to the building, receptacles will also be weather-resistant and be provided with a metal, weatherproof-in-use cover. All outdoor power/data for event usage will be located outside the field of play.

Interior Lighting:

Interior lighting will be LED capable of O-10V dimming. General interior lighting will consist of basket troffers, recessed downlights, and surface mounted or suspended strip fixtures. Specialty fixtures will be located and specified in coordination with the architect for the entry area and other high-profile spaces. Emergency lighting will be provided with battery backup as required per NFPA 101 and IBC. Lighting power density and controls will meet the applicable energy code.

Exterior Lighting:

Exterior lighting will consist of LED lighting. Bollards, pedestrian post top, area lighting, and building-mounted fixtures will be utilized. Fixtures will be required

at building exits for egress lighting. These fixtures will have battery backup. Lighting controls will follow Wichita State University standards and will meet the applicable energy code. An astronomic timeclock will be provided for exterior lighting control.

Stadium Lighting:

Stadium lighting will consist of LED lighting mounted on poles. A performance specification will be provided for a complete stadium lighting system to be provided by a reputable stadium lighting vendor. Power feeders to these poles will be provided per a basis-of-design system. Controls for this system will be provided by the lighting vendor.

Telephone / Data / Security / Access Controls Systems:

The buildings will have data closet(s) to serve IT needs in the building. The building IT equipment will be located in this room with cabling distributed to drop locations throughout the building. Distribution and connection to campus IT systems will be coordinated with Wichita State University IT Staff. Access controls and security systems will be designed by WSU's vendors.

FIRE SPRINKLER

A sprinkler system shall be provided throughout all areas of the new Phase 1A - East Pavilions concession/restroom/retail/green room structures and Phase 2 West Stadium. The systems shall meet the requirements of NFPA 13 and be of a dry or wet pipe type based upon the conditioning of said areas on a year-round basis. The maximum sprinkler zone size shall be 52,000 sq. ft. per NFPA 13. It is anticipated that the covered outdoor party deck and circulation areas will be pro-

Building Systems Cont'd

tected by a dry pipe sprinkler system. All sprinkler system flow and tamper switches shall be monitored by the building fire alarm system.

Offices, sports medicine, press, locker rooms, restrooms, public areas, party deck, circulation and concourses will be designed as light hazard occupancies with a design density of 0.10 gallons per minute per square foot over the hydraulically most remote 1,500 square feet. Electrical, mechanical, equipment, storage rooms, janitorial closets and telecommunications rooms will be designed as ordinary hazard group I occupancy with a design density of 0.15 gallons per minute per square foot over the hydraulically most remote 1,500 square feet. Boiler and mechanical rooms containing gas-fired equipment, concessions will be designed as ordinary hazard group II occupancy with a design density of 0.20 gallons per minute per square foot over the hydraulically most remote 1,500 square feet. Quick response area reductions are permitted by NFPA 13. A 100 gpm hose allowance for light hazard, or 250 gpm allowance for ordinary hazard, shall be included in the hydraulic calculations. Design areas shall be increased by 30% for dry sprinkler systems.

Sprinkler service entrance shall have a riser within the building consisting of a double check backflow preventer, wall-mounted fire department connection. and backflow test connection. Sprinkler systems shall be zoned by floor for the West stadium and each structure in Phase 1A will have its own zone given the small footprint of each structure. The West stadium sprinkler zones will be served from a combination standpipe riser. Each reguired sprinkler zone shall be provided with an indicating control valve, check valve, pressure gauge, flow switch, and test and drain. Dry systems shall consist of an indicating control valve, dry system

alarm valve with all trim and drain, and a riser-mounted air compressor. An exterior electric alarm bell and strobe will be located on an outside wall near the fire department connection. The fire department connections shall be within 100 feet of a fire hydrant and be per local fire department requirements.

Since the West stadium press level is greater than 30 feet above the lowest fire department vehicle access point, a manual wet standpipe system will be required per code. The standpipe system will be connected to the water supply serving the stadium, but since the building is not a high rise, the fire department will provide the necessary flow and pressure via the fire department connection. The required pressure at the top of the standpipe will be 100 psi while flowing 500 gpm from the first remote standpipe plus 250 gpm for each additional with a maximum of 1,000 gpm. Since the standpipe system can be of a manual type, the water supply available to the building does not need to meet the demand. Therefore a fire pump will not be required for the standpipe system, however one might be required for the stadium fire sprinkler system given the overall height of the Press level. This will be determined as the design progresses.

Fire protection piping shall be Schedule 40 black steel. CPVC and Schedule 10 steel piping shall not be allowed. Dry piping shall be galvanized Schedule 40 steel.

Sprinklers shall be quick response in all light hazard spaces. Sprinklers shall be centered in ceiling tiles and shall be concealed with flat cover plates in finished areas with ceilings, and brass upright or pendants in unfinished spaces. Back of house areas may use semi-recessed sprinklers. Concealed cover plates and sprinklers located in finished ceiling areas shall

have finishes as approved by WSU and the architect. Provide sprinkler guards on all sprinklers within 7 feet of finished floor or where otherwise subject to damage. Sprinkler temperatures shall be in accordance with NFPA 13.

Based upon the seismic design category ranking, seismic bracing for the fire sprinkler system maybe required. This will be coordinated with the structural engineer as the design progresses.

FIRE ALARM

An intelligent, digital, addressable fire alarm and detection system will be provided for the East Pavilion structures and the West Stadium building. A new fire alarm primary control unit located in a TBD location will be provided. Initiating and detection devices will all be addressable. When in alarm mode, the system will annunciate the type and location of each initiating device. Notification of Stadium occupants (in areas enclosed) shall be by digital voice speaker system and visual notification appliances. No notification appliances will be provided in the East grandstands or tiered SRO along with the North, South and West grandstands. However, scoreboard textual notifications will be provided. For the Stadium, when an alarm signal is received, speakers and strobes shall be activated throughout the facility. No other systems such as building automation, paging, etc. shall be combined with the fire alarm system. Manual voice announcements shall override any automatic audible notification. The system shall transmit alarm, supervisory, and trouble signals to the owners monitoring station. A remote annunciator will be located at the main fire department point of entry of the stadium.

An automatic photo-electric smoke detector shall be installed above the FACP,

and above any required extender panels. Smoke and fire/smoke dampers (if required) shall have duct detectors installed adjacent to the damper. Duct mounted photo-electric smoke detectors shall be installed in the supply and return air ducts for all air handling units 2000 CFM and larger to provide for automatic shutdown of air handling equipment in the event of smoke detection. Egress doors in smoke or fire barriers on electromagnetic hold opens shall have a smoke detector installed on both sides of the doors. The activation of either smoke detector shall release the doors and allow them to close, maintaining the separation. Smoke detection shall be provided in all elevator lobbies, sprinklered shafts, and machine rooms for elevator recall. Where ambient conditions make the use of smoke detection impractical, heat detection may be used. Heat detection shall be provided in all sprinklered elevator shafts, pits, and machine rooms to shunt trip elevator power prior to activation of sprinklers.

The fire alarm system shall monitor all fire suppression flow and tamper switches. Kitchen hood suppression systems provided by the hood supplier shall be monitored by the fire alarm system.

The system shall use white/clear strobes in red or white housing for fire alarm notification devices. All strobes within view of other strobes shall be synchronized. One-piece speaker/strobe notification devices in red or white housing are permitted. Visual notification is required in all public accessible areas in the building, including but not limited to restrooms, corridors, mechanical rooms, assembly areas, kitchens, locker rooms, and conference rooms.

Fire alarm wiring shall be installed in conduit, and wired as Class B.

Building Systems Cont'd

TRACK & FIELD

Track and Field Layout

The track layout will accommodate both NCAA Track and Field Events as well as Soccer. The track will have nine lanes. Each lane will be 48" wide. The track radius of 35 meters (114'-10") was selected to allow enough width for a full 70 yard soccer field width. The track will have full runout extensions on all four corners to allow for races to be run on either straightaway and in either direction. This layout provides maximum capacity and maximum versatility for competitions and training. Both D-zones will be surfaced track with room to contain High Jump, Javelin, 2 Discuss/Hammer cages, Shotput and Steeple Chase. Jumping events will be located on the track East perimeter. Moving the jumps out of the track interior allows room for soccer. The pole vault and long/triple jumps area will be fully paved with track surfacing to match track construction. All running, jumping and throwing events are sized and designed to be fully compliant with NCAA size and spacing requirements.

Track Construction

All track surfacing areas are to be constructed with synthetic track surfacing over asphalt. All construction will meet or exceed construction requirements and recommendations of American Sports Builders Association (ASAB). Asphalt paving be placed in two lifts with a total thickness of no less than 3". Asphalt base will be a minimum thickness of 6" layer of aggregate road base material over compacted native sub-grade soil. The exact thickness of pavement and aggregate base layers will be determined based on geotechnical report data and recommendations. Track surfacing will be poured in place, multi-layered polyurethane. The specifics of track surfacing materials and

finish will be determined based on University representative selection. Track grading will be sloped to maximize surface runoff while complying with maximum slope restrictions from NCAA rules and regulations.

Natural Grass Field Construction

Track interior space will be designed to accommodate both track throwing event landing zones, as well as additional sports activities including soccer and football. The field surface will be natural grass. Analysis of existing native soil or potential fill soils will be conducted by a certified agronomist laboratory and recommendations for field amendments will be provided. Natural grass cultivar will be selected based on local climate, intended use, and University preference. Either sod or stolons will be installed. Grow in methods will be determined based on construction schedule. Football goal post footings will be installed to allow for football goal posts to be installed temporarily.

Drainage

Track and field drainage will be designed to tie in to full site storm drainage system. The drainage system contained within the limits of the track will be sized to accommodate 100 year 2 hour storm unless local code requirements require otherwise. The track and field storm drain system is anticipated to provide conveyance for the track and field only, outside runoff from seating areas or surrounding landscape will not be part of the track system. Detention or retention within the field area is not anticipated but underground storage can be accommodated if required.

Drainage system will consist of surface drain inlets concentrated at the inside edge of the track connected to a collector pipe. A slot drain will be installed on the full interior edge of the track. Additional small surface drain inlets may be installed

in the natural grass at the outside edges, outside of any sports sideline limits. Perimeter collector will be corrugated HDPE pipe will a single field outlet crossing below the track to connect with site drainage outfall.

Irrigation

Natural grass irrigation will be premium sports field quality sprinkler irrigation. All irrigation equipment will be make and model as dictated by University campus standards. Gear driven rotor sprinklers will be spaced to provide uniform coverage with minimal over spray onto the track. Sprinkler heads will have a throw radius between 55'-65'. Remote control valves will be installed in composite plastic boxes located in the interior of the track edge outside of the sports field sidelines. A dedicated irrigation controller will be installed outside of the track area. The irrigation Controller will be integrated into campus central control irrigation system if required. Mainline connection flow and pressure will be coordinated with on site utilities. If existing water pressure is lower than 70 psi downstream of backflow preventers than a booster pump will be designed and installed. The booster pump will prefabricated with steel skid and enclosure. The pump will be equipped with a Variable Frequency Drive (VFD), Programmable Logic Controller (PLC), and remote access monitoring.

Electrical and Comm Access

Power and communication systems access can be provided within the track and field area. Locations of access boxes will be coordinated with University representatives and electrical/AV engineers. Access point locations are to be determined with track and field events, soccer/football needs and concert/event needs considered. All access points are to be provided with in-ground boxes. Above grade pedestals are not recommended in the track

area for athlete safety. No access boxes will be installed within active use areas on the track or within the sideline area of the field.

Future Considerations for Synthetic Turf Conversion

The University has indicated that the track interior will be converted from natural grass to synthetic turf for use by future Women's Soccer Program. The following items will be considered during design to simplify the conversion process for synthetic turf.

Javelin throwing events are not recommended for synthetic turf. Javelin events within the track will need to be relocated to an alternate location after synthetic turf is install. The existing javelin area will be retained to allow future events. Discuss throwing events can be accommodated with synthetic turf but hammer throw is not recommended. Existing hammer throw locations will be retained to allow for future events.

Storm water runoff is increased when converting from natural grass to a synthetic turf surface due to lower water infiltration rates. The initial installation of the drainage collector pipe and outfall will be sized to accommodate the larger flows of synthetic turf field.

Synthetic turf fields can be installed with sprinkler cooling systems. The natural grass irrigation system will be designed in a manner that will allow it to be converted to synthetic turf cooling system with minimal construction and equipment changes. The irrigation mainline and pump station will be slightly increased in size to account for higher flow and pressure demands of turf cooling systems.
